

Recommendations – Pesticide/Fertilizer Spill Kit Contents Integrity Verification

Due to the necessity of storage locations of spill kits they tend to be exposed to several different elements such as; heat, sunlight, moisture... These elements can break down the contents and kits. This is one good reason to verify integrity of the kits and the contents at least annually. Age of the spill kits can be another reason. Storage of kits and contents in a protected, dry, clean, dark place such as a warehouse will last the longest. Contents storage in a spill kit is considered protected but storage location of a spill kit can also be a factor.

Signs & Symptoms of break down:

- Cracking
- Peeling
- Holes
- Tearing
- Expired Shelf Life
- Broken
- Drying
- Crumbling
